

On the Subject of The Bamboozling Button

"Wait, was that the letter Yankee or the word Y?"

-You, probably

This module consists of a coloured button with two lines of text written on it and a screen that displays a message that is broken into five parts.

Of these display texts:

- The second is always the word "THEN".
- The third ends with a colon.
- The fourth and fifth are coloured.

The cells in the table below are denoted by (i , j) where:

- i is the row index; starting with "A LETTER" = 0
- j is the column index; starting with "WHITE" = 0

The indices in the table corresponding to the-

- display texts are referred to as D1 to D5.
- colours of display texts 4 and 5 are referred to as [D4] and [D5].
- lines of text on the button are referred to as B1 and B2.
- colour of the button is referred to as [B].

These display texts, their colours, the text on the button, and the colour of the button will all be required to obtain the two times when the button should be pressed for each stage.

Section 1: Special Cases

- If any of the display texts are written on the first line of text on the button, double-tap the button when the last digit of the timer is (D4 , [D4]) mod 10.
- Otherwise, if any of the display texts are written on the second line of text on the button, double-tap the button when the last digit of the timer is (D5 , [D5]) mod 10.
- Otherwise, continue to the next section.

Section 2: Default Case

Find the following values in table:

1. $V_1 = (D4 - D1, [B])$
2. $V_2 = (D5 - D3, 14 - [B])$
3. $V_3 = (B1, [D4])$
4. $V_4 = (B2, [D5])$

Section 3: Punctuation

Use the values you have obtained to determine the two times the button should be pressed.

If the first display ends with a comma, then $X = V_3 + V_4$ and $Y = V_1 + V_2$.
Otherwise, $X = V_1 + V_2$ and $Y = V_3 + V_4$.

If the whole message is appended by-

- single inverted commas, then press the button when the sum of the two last digits is $(X \bmod 10) + 3$, and again when it is $(Y \bmod 10) + 3$.
- double inverted commas, then press the button when the sum of the two last digits is $(2X \bmod 10) + 3$, and again when it is $(2Y \bmod 10) + 3$.
- no inverted commas, then press the button when the last digit is $X \bmod 10$, and again when it is $Y \bmod 10$.

Submission Info

Once the button has been pressed, the screen will turn off and will not turn back on until the button is pressed again.

If both button presses are timed correctly, the module will advance to the next stage, indicated by a light on the side turning green.

If either button press is timed incorrectly, a strike will be issued.

If the module issues two strikes in a row, it will reset back to stage 1.
